Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Treating a patient having osteoporosis and is being administered cyclase activating parathyroid hormone or its analogue comprises

84 AA;

Sequence

```
The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PPH, Which regulates extracellular calcium levels) antagonist activity or reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PPH2-84, PPH3-84 and PPH3-84 (appearing as ABG74230-ABG74233). The present sequence is the CIP PTH2-84.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fragments of PTH function as PTH antagonists. The specification the specification of PTH function as PTH antagonists. The specification substantially normal parathyroid function and having hyperparathyroidism. The method comprises determining and comparing at least two of the following parameters: whole parathyroid hormone level, parathyroid hormone inhibitory peptide fragment level and total parathyroid hormone level. The method is used for monitoring (treatments of) parathyroid related bone disease and the effects of therapeutic treatment for
                                                                                                                                                                                                                                                                                                                                                    VSEIQLMHNIGKHLNSMERVEWLRKKLQDVHNFVALGAPLAPRDAGSQRPRKKEDNVLVE

                                                               The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PPH, which regulates extracellular calcium levels) antagonist activity to reduce the occurrence of hypercalcaemia or osteosarcome in the patient resulting from the administration of CAP. The peptide comprises PTH2-84, PTH3-84, PTH3-84 and PTH28-84 (appearing as ABG74230 upon which the CIP peptides are based:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61

The specification describes a method for differentiating between a person having substantially normal parathyroid function and having hyperparathyroidism. The method comprises determining and comparing at least two of the following parameters: whole parathyroid hormone level, parathyroid hormone inhibitory peptide fragment level and total parathyroid hormone level. The method is used for monitoring (treatments of) parathyroid related bone disease and the effects of
                                                                                                                                                                                                                                                                                                                                                                      Differentiating between normal parathyroid function and hyperparathyroidism comprises determining and comparing whole parathyroid hormone, parathyroid hormone inhibitory peptide fragment

The invention relates to treating a patient having osteoporosis comprising administering a cyclase inhibiting parathyroid hormone peptide (CIP) or its conservatively substituted variant exhibiting a parathyroid hormone (PTH, which regulates extracellular calcium levels) antagonist activity to reduce the occurrence of hypercalcaemia or osteosarcoma in the patient resulting from the administration of CAP. The peptide comprises PTH2-84, PTH34-84 and PTH28-84 (appearing as ABG74230-ABG74233). The present sequence is the CIP PTH34-84.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2 SEIQLMHNLGKHLNSMERVEWLRKKLQDVHNFVALGAPLAPRDAGSQRPRKKEDNVLVES

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human PTH refers to the mature form of the hormone, which consists of 84 amino acids arranged in the sequence reported by Kimura et al, 1983, Brochem. Blophys. Res. Comm., 114(2):493.
Examples of variants are given in AAR2845.48 and AAR29561-69.
(Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                Variants of PTH exhibiting PTH activity and reduced sensitivity to oxidation are obtained by replacing at least one Met residue in PTH approximation are obtained by replacing at least one Met residue is ofther than Met and Cys.

The Met amino acids are indicated in the Features Table.

The variant may be obtd. using recombinant technique, and may be used for treating osteoporosis, other bone-related disorders.

PSOSIBSIS and cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proteolytic;

The DNA sequence was produced by enzymatically ligating coligodeoxynucleotides. hPTH is an important regulator of calcium metabolism and has clinical applicns, to diseases such as hypoparathyroidism and osteoporosis. This hPTH can be used as a therapeutic agent or to study the biological role of hPTH in vivo.

An alternative method of producing the peptide comprises expressing the FPC as part of a inclusion body. The target peptides of the FPC are pertained from growth hormone releasing factor (GRF), glucagon-like peptide I (GLPI) or parathyroid hormone (FTH). This sequence corresponds to amino acids 1-84 of FTH.
                                                                                                                                                                                                                                                                                                                                                               Parget peptide (PTH(1-84)) used in fusion protein construct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      is used in the construction of a chimeric protein betagal-1395(FM)PPH84. The enzyme Kex2 protease can be used for excision of a desired protein from a chimeric protein comprising the desired protein and an Arg-Arg. Lys-Arg or Pro-Arg sequence adjacent to the N terminus of the desired protein. It can be specifically used for cleaving this human parathyroid hormone peptide hPH41-84) or peptide hPH41-34) from chimeric proteins such as the beta Gal-1395(FM)PFH84 or CAFPH34. Derivatives of Kex2 protease, and especially Kex2-660 can also cleave such chimeric proteins with high specificity and efficiency even in the absence of urea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 VSEIQLMHNLGKHLNSMERVEWLRKKLQDVHNFVALGAPLAPRDAGSORPRKKEDNVLVE

The present sequence represents human parathyroid hormone (hPTH). It, and its fragments, are used in the method of the invention. The specification describes a method for building bone mass, comprising
                  coadministration of a parathyroid hormone with a 3-(substituted phenoxy)benzo(b)thiophene compound. The method is used for treatment of bone loss, e.g. in osteoporosis.
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protection, endogenous therapeutic peptide; peptidase, conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

The invention relates to a DNA sequence containing a fragment of the human parathyroxin (hPTH) gene. The invention also relates to splicing strificially synthesised oligodeoxynucleotide chains by PCR and preparing fusion or non-fusion expressed engineering bacteria of recombination protein hPTH through integrating the gene in different expression carriers. This sequence represents a human parathyroxin related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 VSEIQIMHNLGKHINSMERVEWLRKKIQDVHNFVALGAPLAPRDAGSQRPRKKEDNVLVE 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and malefunido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptides stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 VSEIQLMHNLGKHLNSMERVEWLRRKLQDVHNFVALGAPLAPRDAGSQRPRKKEDNVLVE 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB9241 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Claim 5; Fig 18; 56pp; English.

The invention relates to a method for regulating proliferation or enhancing differentiation of mammalian skin or hair cell. The method involves administering nucleic acids encoding peptides derived from N-terminal region of human parathyroid hormone (hPPH) or hPTH-related peptide (PTHPP). The method is used for inhibiting hyperproliferative ck hait disorders such as psordasis, ichthyosis, acid, acid

J. FUNCTION: PTH ELEVATES CALCIDN LEVEL BY DISSOLVING THE SALTS
BONE AND PREVENTING THEIR ENAL EXCRETION.
-!- DISEASE: Defects in PTH are a cause of familial isolated
hypoparathyroidism (FIH) [MIM:146200].
-!- SIMILARITY: BELONGS TO THE PARATHYROID HORMONE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-93345518; PubMed-8344299;

"Genome sequence and analysis of the oral bacterium Fusobacterium

nucleatum strain Arcc 25586.";

J. Bacteriol. 184:2005-2018(2002).

I. FUNCTION: Catalyzes the first step in hexosamine metabolism,

converting fructose-6P into glucosamine-6P using glutamine as a

nitrogen source (By similarity).

-I- CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     28-FEB-2003 (Rel. 41, Created)

Bacteriol. 183:4623-4838(2001).

1. FUNCTION: Poorly processive, error-prone DNA polymerase involved in untargeted mutagenesis. Copies undamaged DNA at stalled replication forks, which arise in vivo from mismatched or mismaligned primer ends. These mismligned primers can be extended by poliv. Exhibits no 3'-5' exonuclease (proofreading) activity. May be involved in translessional synthesis, in conjunction with the beta clamp from polir! (By similarity).

C. CATALYIC ACTIVITY: N deoxynucleoside triphosphate - N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. Patent No. US20020160945A1

GENERAL INFORMATION:

APPLICANT: Cartor. Thomas

TITLE OF INVENTION: CYCLASE INHIBITING PARATHYROID HORMONE

TITLE OF INVENTION: ANTAGONIST OR MODULATORS AND OSTEOPOROSIS

FILE REFERENCE: 5321-2000.18/09/928,047B

CURRENT APPLICATION NUMBER: US/09/928,047B

CURRENT FILING DATE: 2001-08-10

PRIOR FILING DATE: 2000-08-10

NUMBER OF SEQ ID NOS: 8

SOSTWARE: FASTSEQ for Windows Version 4.0
